How to read this manual

If you are setting up for the first time, work through sections 3 to 6 in order — each one depends on the last. If the shop is already running, jump straight to the section you need.

1. Before You Begin

What this software does

Parivar Jewellery ERP runs a retail jewellery shop end to end. It keeps your stock piece by piece, makes GST tax invoices, tracks what every customer owes you in **both rupees and gold**, records purchases from suppliers, follows orders given to karagirs, handles metal sent for refining, and runs monthly gold saving schemes.

It works without internet

Everything runs on your own computer. No internet connection is needed to make a bill, and your customer and stock information never leaves the machine. The only time the software opens the internet is when you press the WhatsApp or Email button, and even then it just opens WhatsApp or your mail program with the message ready — **you still press send yourself**.

Installing

- 1 Run the installer and choose where to install.
- 2 Open **Parivar Jewellery ERP** from the Start menu or desktop shortcut.
- 3 The first time it opens, the software creates an empty database and fills in standard item groups (22K, 18K and so on) and standard accounts for you.

Signing in the first time

The software asks for a username and password every time it opens. On a brand-new installation there is one account ready for you:

Username: admin
Password: admin

Change this password before you start billing

Until you do, anyone who has heard of this software can open your books. Sign in, go to **Settings → Users**, and change it. The software keeps warning you on that screen until you have.

Where your data is kept

All your data sits in a single file on this computer. You can see its exact location at any time under **Settings → Data & Backup**.

Your data is only on this computer

There is no copy anywhere else. If this computer is lost, stolen or its hard disk fails, your books are gone with it. Take a backup at the end of every working day — see section 16. It takes ten seconds.

The order to set things up

Each step below needs the one before it, so follow this order the first time:

Step	What you do	Section
1. Shop details	Name, address, GST number, bank details — these print on every bill	3
2. Items	Create Ring, Chain, Bangle and so on	4
3. Stock	Enter each physical piece and get a tag number	5
4. Customers	Add regular customers with their old balance	6
5. Start billing	You are ready	7

2. Signing In & Getting Around

Signing in

Type your username and password and press **Sign In**. If either is wrong you are told only "Invalid username or password" — the software never reveals which part was wrong, so nobody can fish for valid usernames.

A login the owner has **disabled** cannot sign in at all, even with the correct password.

Signing out

Your name sits at the top right. Click it and choose **Sign out**. Do this whenever you leave the counter — the next person signs in with their own login, so the shop knows who did what.

The same menu has **Users & Password**, which jumps straight to where you can change your own password.

The sidebar (left side)

Everything in the software is reached from the left sidebar, arranged in four groups.

Group	Screens
Overview	Dashboard
Transactions	Sales Invoice, Sales Register, Purchase, Receipts, Orders, Refining, Gold Scheme
Masters	Item Creation, Tag & Barcode, Customers, Suppliers
Reports	Stock Report, Stock Verification, Day Book, Ledger / Khata, Accounting Books
System	Settings

The small grey letters on the right of each row — **F2**, **F3** and so on — are shortcut keys. Pressing that key opens the screen instantly from anywhere.

The ☰ button at the top left shrinks the sidebar to icons only, giving you more room for wide screens like the sales bill. Press it again to bring the names back.

The top bar

Page name	Which screen you are on, with a short description under it
Search or jump to...	The search box — see below
Shop name and date	Confirms which shop file is open and today's date
Moon / Sun button	Switches between light and dark appearance

The search box — the fastest way to work

Press **Ctrl** + **K** anywhere in the software. A search box opens in the middle of the screen. Start typing and it will find:

- **Any screen** — type stock and press Enter to open the Stock Report.
- **Any customer or supplier** — type a name and press Enter to open their khata directly.

Use the **↑** and **↓** keys to choose, **Enter** to open, **Esc** to close.

Light and dark appearance

The moon button switches to a dark screen, which is easier on the eyes in a dim shop or at night. Your choice is remembered the next time you open the software.

Things that behave the same everywhere

- **Grids grow by themselves.** Whenever you start typing in the last empty row of a table, a fresh blank row appears below. You never need to press an "add row" button.

- **Grey boxes are calculated.** If a box has a grey background you cannot type in it — the software works it out for you (net weight, fine weight, amounts, totals).
- **Delete a row** by moving your mouse over it and clicking the small ✕ that appears on the far left.
- **Messages** appear briefly at the bottom right — green tick for success, red for a problem. Read the red ones; they explain exactly what is wrong.

2b. Before You Trust This Software

Read this before you move your shop onto it. It is the most important page here.

Run both systems side by side first

For at least a week — a month is better, and a month that includes a busy day is better still — keep entering every bill, purchase and receipt in whatever you use now *as well* as here. Yes, it is double work. It is the only way to find out whether the two agree before your books depend on the answer.

- 1 Set the shop up (section 3) and enter your **opening balances**: cash in hand, bank, what each customer owes you, what you owe each supplier, and your stock. If a customer is *in credit*, enter the amount as **Cr** rather than as a minus.
- 2 Enter the **metal** too, which is easy to forget. Tagged pieces go in on the tag grid; loose bullion and scrap in the safe go in under **Tag & Barcode** → **Made from loose metal** → **Opening metal**. Do not enter it as a purchase — you do not owe anyone for it. If a goldsmith is holding your gold, put that on his record as an opening metal balance.
- 3 Work normally for a week or a month, entering everything in both systems.
- 4 Open **Changeover Check**. Set the date to the last day you entered.
- 5 Type what your **old** system says for each figure — cash, bank, customers owing, suppliers owed, gold on hand, stock value, GST, scheme deposits.
- 6 Anything marked **Differs** is a question to answer *before* you switch, not after. The screen tells you where to look, and lists every customer and supplier so you can find which one is out.

A box you leave blank is reported as **Not checked** — never as agreement. An empty form does not mean everything is fine; it means you have not looked yet.

The usual reasons a figure will not tie

Stock value is low	Pieces with no Cost/Gm are left out of the valuation entirely. The screen tells you how many. Fill them in on the Stock Report.
Cash or bank is out	Check the account's opening balance under Settings → Accounts. It is the figure most often forgotten on day one.
A customer is out	Their opening balance, or a bill entered in one system and not the other. The lists at the bottom of the screen show every party.
Gold on hand is out	Count the trays. Remember loose metal and old gold in the safe count too, not just tagged pieces.

When everything you care about says **Agrees**, and it still does after a second week, you can stop the double entry.

3. First-Day Setup

Open **Settings** from the bottom of the sidebar. There are seven tabs.

Company tab — your shop details

Everything here prints on your bills, so type it exactly as it should appear.

Company Name	Your shop name, printed large at the top of every bill
Address	Printed under the shop name
Phone	Printed as "Contact No." on the bill
GSTIN	Your GST registration number
State	Used as the default place of supply on bills
Financial Year	From and to dates, normally 1 April to 31 March. Reports use this.

Bank Details

Bank name, account number, branch and IFSC code. These print in a box on the bill so customers can transfer money to you. Leave them blank if you do not want them printed — or switch the whole box off in the Invoice Design tab.

Invoice Declaration

The legal sentence printed in small type at the bottom of the bill. A standard GST declaration is filled in already. Change it if your accountant advises different wording.

Press **Save Settings** at the bottom right when done.

Invoice Design tab — how your bill looks

The right half of this screen shows a **live preview** of a real bill. Every change you make appears there immediately, so you can see the result before printing anything.

Paper	A4 Sheet for a full tax invoice, or Thermal 3in for a small till-roll receipt
Document Title	Normally "TAX INVOICE". Change to "ESTIMATE" or "CASH MEMO" if you prefer
Accent Colour	The colour of your shop name and the highlight bands on the bill
Footer Note	An extra line under the totals, for example "Goods once sold will not be taken back"
Item Columns	Tick only the columns you want printed: HSN, Purity, HUID, Qty, Gross Wt, Net Wt, Rate, Making
Sections	Switch whole blocks on or off: shop name header, old gold table, bank details, declaration, signature row, pending balance

Try before you commit

Press **Test Print** to print one sample bill on your actual printer and check the alignment. When you are happy, press **Save Design**. Press **Reset to default** to undo everything and start again.

Bill Numbering tab

Shows each type of document, its letter prefix, and the next number that will be used. You have three sales series ready to use:

Prefix	Used for
COM	Normal retail bills over the counter
ESM	Estimates — a quotation before the customer decides
Service	Repair and service bills

Purchases use MI, refining MO, receipts VR, payments VP, orders NO, and gold schemes GS.

A power cut cannot corrupt your books

If the power drops mid-bill, or someone pulls the plug, the half-finished bill is simply not saved — the software either writes a document completely or not at all, never half-way. When the power comes back, open the software and carry on; the last saved bill is the last one you will see. Take your daily backup anyway (section 16): it protects against a failed *disk*, which no software can.

Numbers are never reused

Once a bill number is given out it is gone forever, even if you delete that bill. This is deliberate — a missing number in your books is far safer than the same number appearing on two different bills.

Accounts tab

The list of accounts the software posts to — Cash, Bank, Sales, Purchase, GST Payable, Old Gold Purchase, Gold Saving Scheme and Shop Expenses. These are created for you and marked "System". You do not need to change anything here.

Taking cards

Open your bank account from the list and tick **Card swap account**. Enter what the bank charges, split two ways: **For Customer in %** is added to their bill, **For Us in %** is what you absorb.

On a bill paid by **Card**, the customer's share appears as *Card Charges* in the totals, and your share is recorded against a **Card Charges** expense head so you can see what taking cards actually costs you over a year.

Card charges are added after GST

The fee is the bank's, not part of what you sold — so tax is worked out on the goods first and the fee is added afterwards. Only one account can be your card account.

The fee is worked out on what actually went through the machine. On a **credit** bill where the customer has not paid yet, no card has been presented, so there is no fee — it appears when they pay.

Making & Wastage tab — rates you charge every day

Most shops charge the same making on the same kind of item, day after day. Set it once here and it fills itself in from then on.

- 1 Choose **Making** or **Wastage** at the top.
- 2 Press **New Rule**.
- 3 Pick a **whole item group** (for example all 22K Gold) or **one item** (for example only Bangles).
- 4 Type the rate and press **Save**.

Making per gram	Charged on the net weight, the usual way
Flat charge per piece	For items you charge a fixed making on, whatever they weigh
Wastage %	Your usual wastage on a purchase from a supplier

An item's own rule beats its group's. Set 22K Gold to ₹400 and Bangles to ₹550, and bangles are charged ₹550 while every other 22K item is charged ₹400. Where a number came from is shown under the box, so nothing appears from nowhere.

The rates fill themselves into three places:

- the **Making /gm** box when you tag a new batch of stock;
- the making on a **bill line**, if that piece was tagged without one;
- the **Wastage %** on a purchase line.

These only start you off

A rate that has filled itself in is just a starting point — change it on any row, any time, and what you leave there is what is saved. The software will never go back and change a bill or a tag you have already saved. That matters most when the right answer is *nothing*: if you gave making free on a bill, it stays free.

Users tab — staff logins

Give every person who uses the software their own login. Never share one.

The three roles

Role	Who it is for
Staff	Counter salesmen — billing, receipts, orders, entering stock, viewing reports
Manager	Everything Staff can do, plus refining (melting metal) and removing tags from stock
Owner	Full access — staff logins, shop settings, deleting documents, backups

What each role may do

Task	Staff	Manager	Owner
Billing, receipts, orders, stock entry	Yes	Yes	Yes
Reports, khata and exports	Yes	Yes	Yes
Refining — melting metal	No	Yes	Yes
Deleting a tag from stock	No	Yes	Yes
Deleting a bill, purchase or receipt	No	No	Yes
Shop settings and bill numbering	No	No	Yes
Creating and managing staff logins	No	No	Yes
Taking a database backup	No	No	Yes
Restoring from a backup	No	No	Yes

This same table appears inside the software, so staff can see what they may do.

Creating a login

- 1 Go to **Settings** → **Users** and press **Add Staff**.
- 2 Enter their full name and a username with no spaces, for example ramesh.
- 3 Choose the role. When in doubt choose **Staff** — you can raise it later.
- 4 Set a password of at least four characters and confirm it.
- 5 Press **Create Login** and tell them the password.

Managing logins

Change a role	Pick a different role from the dropdown on their row
Disable a login	Press Disable . Use this when someone leaves — better than deleting, because their history stays clear.
Forgotten password	Press Reset password , set a new one and tell them
Delete a login	Removes it completely. Documents they created are unaffected.

Protections you cannot switch off

The built-in admin account can never be deleted or disabled, so you cannot lock yourself out. You also cannot disable your own login or remove your own owner access.

Changing your own password

Anyone can change their own password under **My Account** on the Users tab. You must type your current password first, so someone who finds an unattended screen cannot lock the real user out.

Passwords are stored safely

Passwords are never saved as you typed them. Each is scrambled with a random value unique to that account, so even someone who copies your data file cannot read them.

Data & Backup tab

Shows where your data file is, and lets you take a backup or restore one. See section 16.

4. Creating Items

Press **F6** or click **Item Creation**.

What an "item" means here

An item is a *kind* of ornament, not a single piece. "Ring" is one item, even though you may have forty rings in the shop. The individual rings are entered later as tags (section 5).

Item Types and Item Groups

Before creating items, understand these two lists:

- **Item Type** — the metal: Gold, Silver, Platinum, Diamond, Stone.
- **Item Group** — the quality within that metal, and this is what **sets the purity**: 22K Gold is 91.6%, 18K Gold is 75%, Silver is 92.5%, and so on.

Both lists are ready to use. To add your own, press the **Item Groups** or **Item Types** buttons at the top of the screen. When adding a group, type its name, its purity percentage, and pick which metal it belongs to.

Creating an item

- 1 Press **New Item**.
- 2 **Item Name** — for example Ring.
- 3 **Item Type** — Gold.
- 4 **Item Group** — 22K Gold. The purity shown beside each group is what will be filled in automatically when you enter stock.
- 5 **Design** — optional, for example Antique or Filigree.
- 6 **Weight / Qty** — see the explanation below.
- 7 **UOM** — the unit: GRAM, CARAT, PCS or TOLA.
- 8 **HSN Code** — the GST code printed on the bill. 7113 is the usual code for gold jewellery.
- 9 **Reorder Level** — optional. Set the smallest number of pieces of this item you want to keep. When stock drops below it, a red *Reorder alert* appears at the top of the Stock Report telling you how many are short. Leave it 0 to switch the alert off.
- 10 Press **Save**.

Weight-wise or Quantity-wise?

Choice	Use it for	How it is priced
Weight-wise	Almost everything — rings, chains, bangles, necklaces	Net weight × rate per gram
Quantity-wise	Things sold by the piece — coins, fixed-price articles	Number of pieces × rate

The tag prefix

As you type the item name, the software shows the tag prefix it will use — the first three letters in capitals. Ring becomes RIN, so its pieces will be tagged RIN00001, RIN00002 and so on. Necklace becomes NEC.

Deleting items

Once an item has stock tags against it, the software will not let you delete it — that would leave your stock records pointing at nothing. Delete the tags first if you genuinely need to remove the item.

5. Entering Your Stock (Tag & Barcode)

Press **F7** or click **Tag & Barcode**. This is where every physical piece in your shop is entered and given its own tag number.

Entering pieces

- 1 Choose the item from **Select Item** — for example Ring. The prefix and default purity for that item appear beside it.
- 2 A grid appears. **One row is one physical piece.**
- 3 Fill in the weights across the row. A new blank row appears as soon as you start typing.
- 4 Check the totals under the grid, then press **Save ... tags**.

What each column means

Gross Wt	The full weight of the piece as it comes off the scale, including stones
Black B.	Weight of black beads, if any
Stone Wt	Weight of stones set in the piece
Stone Rate	Price per unit of stone weight. The stone value is charged on top of the metal on the bill. Leave blank for a plain gold piece.
Dia. Wt	Diamond weight. Like stones, it comes out of the metal — diamonds are not gold — and is priced separately.
Dia. Rate	Price per unit of diamond weight.
Purity %	Filled in from the item group (91.6 for 22K). Change it for an odd piece.
Mkg/Gm	Your making charge per gram for this piece. Filled into the bill automatically later.
Hallmark	Hallmarking charge for this piece
Cost/Gm	What <i>you</i> paid, per gram of fine metal. Used for the stock valuation on the Stock Report. Never printed on a customer's bill — leave it blank if you would rather not record it.
Qty	Only for quantity-wise items such as coins
Net Wt auto	Gross – Stone – Black beads – Diamond. The actual metal.
Fine Wt auto	Net × Purity ÷ 100. The pure gold content.
HUID	The six-character hallmark ID, if the piece has one

Example – a 22K ring

Gross Wt	10.000 g	
Stone Wt	0.000 g	
Net Wt	10.000 g	(10.000 – 0.000)
Purity	91.6 %	
Fine Wt	9.160 g	(10.000 × 91.6 ÷ 100)

Tag numbers

You do not type tag numbers. When you save, the software gives each piece the next free number for that item — RIN00001, RIN00002 and so on. Write this number on the physical tag you tie to the piece, or print a barcode for it.

The totals line

Under the grid you see **Gross Wt**, **Net Wt**, **Fine Wt** and **Pieces** for everything you are entering. Check these against your physical weighing before saving — it is the easiest moment to catch a typing mistake.

The stock list below

Everything already tagged is listed underneath. You can search by tag or item name, and filter by **In stock**, **Sold** or **All**. **Export** saves the list as a CSV file you can open in Excel.

You cannot delete a sold tag

Once a piece has been billed, its tag is part of that bill's history. If the tag was entered wrongly, correct or delete the *bill* — the piece then returns to stock and can be deleted or re-entered.

Tagging many pieces at once

Entering forty bangles one row at a time is slow. There are four faster ways.

1. Set what is the same for every piece

Above the grid is a **Same for every piece** row — purity, making per gram, hallmark charge, location, and **Category** (Ladies/Gents), **Salesman**, **Shelf / Tray** and **Size**. Anything you set there is stamped onto every piece in the batch. Press **Apply to all rows** to push it onto rows you have already typed. Later, the Stock Report can group your stock by Category, Salesman or Shelf / Tray, so you can see what is where.

If you have set up a **Making Master** (section 3), the making per gram is already filled in when you choose the item, and a note under the box tells you which rule it came from. Change it whenever a batch is different — the master only starts you off.

Bag Weight comes off the metal

If you weigh a piece in its pouch, put the pouch's weight in **Bag Wt**. It is taken off before the piece is priced, exactly like stones and beads are — so the customer is never charged a gold rate for plastic.

Which labels still need printing

The tagged-stock list has a **Not printed only** filter. Every piece shows **Not printed** until its label has actually come out of the printer, so you can work through a big batch over several sittings without labelling anything twice. A piece is only counted once you press **Print** — cancel the dialog and it stays on the list.

2. Duplicate a row

Type one piece, then press the $\times 10$ button at the end of its row to make ten more copies of it. Change the number beside **Add rows** to duplicate a different amount. Every copy still gets its own tag number when you save.

Use this for batches of identical items — coins, plain bangles, standard chains.

3. Paste from Excel

Weigh everything into a spreadsheet, copy the block of cells, and paste anywhere in the grid. One line becomes one piece. The columns must be in this order:

Gross Wt, Black Beads, Stone Wt, Purity, Making/gm, Hallmark, Cost/Gm, Qty, HUID, Location, Stone Rate, Dia. Wt, Dia. Rate

Only the first column is required — leave the rest blank to use your defaults. The stone and diamond rate columns are at the end, so a spreadsheet made before they existed still lines up.

If your file has a **header row**, the columns are matched by name, so the order does not matter and an older file that has no *Cost/Gm* column still loads correctly. Only a headerless paste relies on the exact order above.

4. Import a CSV file

- 1 Press **Import CSV** above the grid.
- 2 Press **Download template** to get a correctly-shaped file, or paste your rows straight into the box.
- 3 Check the **preview** — it shows the net and fine weight worked out for every row before anything is created.
- 4 Press **Load rows**. They appear in the grid.

- 5 Check the totals against your physical weighing, then press **Save**.

Nothing is created until you press Save

Importing only fills the grid. You always get to look at the rows and the totals first, and you can still edit or delete any of them.

Printing barcode labels

In the **Tagged Stock** list, tick the pieces you want (or the box in the header to take all of them) and press **Print labels**.

Label size	Jewellery tag roll (50 × 12 mm), A4 sheet of 65, or A4 sheet of 24
Copies each	Two labels per piece if you tag both ends of a dumbbell tag
Skip labels	Start part-way down a sheet you have already used some of
Show on the label	Item name, purity, gross weight, net weight — tick what fits

The preview shows exactly what will print. The barcode is standard **Code 128**, which every ordinary barcode scanner reads without any setup — scan it straight into the Tag box on a sales bill.

Check the alignment first

Print one sheet on plain paper and hold it against your label sheet before running the real ones.

Loose metal and tagged pieces

Your gold sits in the shop in two forms, and the software keeps them apart.

Form	What it is
Tagged pieces	Finished ornaments, each with its own tag number, ready to sell
Loose metal	Bars, scrap, metal back from the refiner, and old gold bought from customers — no tags, just weight

Your total stock is both added together. The Day Book shows the split, so you can see at a glance how much is on the shelf and how much is still waiting to be made up.

Turning loose metal into pieces

When the karagir turns your bar into bangles, that weight must **move** from loose to tagged — not be added again. Otherwise buying 100 g and then tagging 100 g of bangles would look like 200 g of gold, and your books would be wrong.

- 1 Open **Tag & Barcode**.
- 2 At the top, switch **Where is this metal from?** to **From loose metal**.
- 3 A band appears showing how much loose metal you have and how much these pieces will use.
- 4 Enter the pieces exactly as normal — the same grid, duplicate, paste and import all still work.
- 5 Press **Convert**.

The tags are created and the same fine weight comes out of your loose stock. Your total gold does not change — it has only changed form.

```
Before  loose 50.000 g   tagged  0.000 g   total 50.000 g
        Convert 40 g of loose metal into one kada
After   loose 10.000 g   tagged 40.000 g   total 50.000 g
```

The software will not let you use metal you do not have

If the pieces need more fine weight than is loose, the band turns red, it tells you how much you are short, and Convert is blocked. Either the weights are wrong, or a purchase has not been entered yet.

Which mode should I use?

New stock when you are first entering what is already in the shop, or for pieces bought ready-made as finished ornaments. **From loose metal** whenever the pieces were made from bar or scrap you already own.

Working on many tags at once

The tick boxes in the stock list also let you **Export** just those rows, or **Delete** them together. Pieces that have been sold or melted are skipped — the software tells you how many it could not remove.

Starting with a shop full of stock

Take one item at a time — all your rings, then all your chains. Weigh a batch into a spreadsheet, import it, check the totals, save, then print and tie the labels on. Slow the first time, quick forever afterwards.

6. Customers and Suppliers

Press **F8** for **Customers. Suppliers** is just below it and works identically.

Do I have to add every customer?

No. For a walk-in cash sale you can simply type a name on the bill and leave it at that. Add a customer properly when you want to:

- give credit and track what they owe you,
- keep a khata of their old gold and past purchases,
- send them bills and reminders on WhatsApp,
- enrol them in a gold saving scheme.

Adding a customer

Press **New Customer**. The form is in five parts.

Identity

Name (required), Mobile, WhatsApp No, Email, Reference Name. The WhatsApp number is used when you send bills and reminders — if it is the same as the mobile, type it in both.

Address

Area, City, Taluka, District, State and full address. Area is worth filling in — reports can group your customers by area.

KYC & Dates

Aadhaar, PAN and GSTIN for larger transactions. Birth date and anniversary let you greet customers — a small thing that brings people back.

Opening Balance — money

This is where you enter what a customer already owed you before you started using this software.

Side	Meaning	Example
Debit (Dr)	They owe you	Customer took goods worth ₹9,500 on credit
Credit (Cr)	You owe them	Customer paid ₹2,400 advance

Enter opening balances once, carefully

Get these right at the start. If you change an opening balance later, every balance and khata for that person shifts by the difference.

Opening Metal Balance — gold

Separately from money, a customer or supplier can owe you *metal*. If a supplier is holding 50 grams of your fine gold, enter 50 against Gold on the Debit side. This feeds the gold khata described in section 14.

The customer list

Shows name, mobile, area, city, GSTIN and current balance. Balances are colour-coded: **red Dr** means they owe you, **green Cr** means you owe them. A badge at the top shows total outstanding. Click any row to open and edit; **Export** saves the list to CSV.

Customers with transactions cannot be deleted

Deleting them would break their bills and khata. This is intentional.

7. Making a Sales Bill

Press **F2** — the screen you will use most. It is one page: customer at the top, items in the middle, money at the bottom.

Step 1 — the customer

Start typing a name in **Customer**. Matching customers appear; use **↓** and **Enter**, or click one. Mobile and area fill in automatically.

- **New customer standing at the counter?** Press the **+** button beside the box. Enter name and mobile, press **Save & use**, and you are back on the bill with them selected.
- **Walk-in cash sale?** Just type the name and carry on. Nothing else needed.

If the customer has an old balance, it appears in a coloured badge: *Previous balance ₹9,500.00 Dr.* Click **View khata** beside it to see their full account.

Bill settings

Series	COM for a normal bill, ESM for an estimate, Service for repairs
Bill No auto	The next number in that series
Bill Date	Today by default
Payment	Cash if paid now, Credit if on account

Step 2 — the items

There are three ways to put a piece on the bill.

Method	How
Scan the barcode	Click the Tag box and scan. Everything fills in instantly.
Type the tag	Type RIN00002 in the Tag box and press Enter .
Search by name	Type in the Item box. A list of matching pieces in stock appears showing tag, weights and purity. Choose one with ↓ and Enter .

However you choose it, the weights, purity, making rate and hallmark charge all come across from the tag. **You only have to type the rate per gram.**

For a **stone or diamond piece**, the grid has **Stone Rate**, **Dia. Wt** and **Dia. Rate** columns. The stone and diamond weight come *out* of the metal — they are not gold — and are charged separately at their own rate, shown as *Stone Amount* and *Diamond Amount* in the bill summary. If the piece was tagged with these rates, they fill in for you. For a plain gold piece, leave them blank and nothing changes.

The line total is worked out as you type. Start typing in the last row and a new row appears for the next piece.

Step 3 — old gold given by the customer

Very common: the customer brings old jewellery and puts its value against the new purchase. Click **Add old gold** in the "Old Gold Received (URD)" section.

Name / Description	For example "Old Gold" / "chain"
Gross Wt, Net Wt	As weighed
Purity %	What you have tested it at — for example 80
Fine Wt auto	$\text{Net} \times \text{Purity} \div 100$
Rate	The rate per gram you are allowing for pure gold
Amount auto	$\text{Fine Wt} \times \text{Rate}$ — deducted from the bill

Example

Old chain, 3.000 g net, tested at 80% purity, allowed at ₹4,500 per gram

Fine Wt $3.000 \times 80 \div 100 = 2.400 \text{ g}$
Amount $2.400 \times 4,500 = ₹10,800.00$ deducted from the bill

Weight-wise bills — settling in metal instead of money

Some customers deal in gold rather than in rupees: they bring old gold, take new ornaments, and settle the difference in **weight**. Tick **Weight-wise bill** and a **Balance Weight** section appears.

The app works out what the customer owes you in pure gold:

Metal Owed = Fine weight sold - Fine weight of old gold taken in

Then you enter how much of that they are paying for *now*, and at what rate. Whatever is left stays owed **as gold**.

Metal Owed auto	Fine sold minus fine taken in
Settle Now	How many fine grams they are paying for today. Leave blank to settle it all.
Rate/Gm	The rate per fine gram you have agreed
Amount auto	Settle Now × Rate/Gm — this becomes the bill
Pending Wt auto	Metal Owed – Settle Now. Still owed in grams .

Example

Sold Ring 15.000 g at 100% = 15.000 g fine
Old gold chain 6.000 g at 100% = 6.000 g fine

Metal owed 9.000 g

Settle now 5.000 g at ₹5,000/g = ₹25,000.00 bill amount
GST 3% = ₹750.00

Total ₹25,750.00
Pending weight 4.000 g still owed as gold

Pending weight is not money.

It is gold the customer still owes you. It shows on their **gold khata** (Ledger → Gold), not in their money balance, and it stays there until they bring the metal or you raise another bill to settle it.

Making charges are still charged in cash

Making and hallmarking are labour, not metal, so they are added to the bill in rupees as normal. Only the metal itself is settled by weight.

Step 4 — money and adjustments

Amount Received	What the customer is paying now. Leave blank for full credit.
Payment Mode	Cash, UPI, Card, NEFT, Cheque or Bank
Bill Discount	Rupees off the whole bill
Making Discount	Rupees off the making charges only
Redeem Points	Only for loyalty members. Shows how many points they have and what each is worth; type how many to spend and the value comes off the bill. You cannot spend more than they have, or more than the bill is worth.

Other Charges	Anything extra to add
Saving Scheme	Only if the customer has an open gold scheme. Pick it and their balance settles the bill — after GST, because it is their own deposit rather than a discount. See section 12.
GST %	3% by default
Salesman	Who made the sale
Manual Bill No	Your handwritten book number, if you keep one
GST not required	Tick to make a bill with no GST

Loyalty points

Tick **Enable loyalty points** on a customer's record and every bill earns them points — a percentage of the goods value, which you set in **Settings → Company → Loyalty Programme** along with what one point is worth. Points come off a later bill *before* GST, so tax is charged on what the customer really pays. Their balance is worked out from their bills, so correcting or deleting a bill fixes the points automatically — there is nothing to adjust by hand.

Step 5 — check and save

The **Bill Summary** on the right builds up as you work:

Goods Amount	55,080.00	net weight × rate
Making Amount	3,600.00	net weight × making per gram
Bill Amount	58,680.00	
GST @ 3%	1,760.40	
Total	₹60,440.40	
Less: Old Gold	- 10,800.00	
Balance Due	₹49,640.40	

Button	What it does
Save	Saves the bill without printing
Save & Print	Saves and sends the bill to your printer
PDF	Saves the bill as a PDF file
WhatsApp	Opens WhatsApp with the bill details typed out, ready for you to send
New Bill	Clears the screen for the next customer

When you save, the pieces on the bill leave your stock, the customer's khata is updated, and the money is recorded.

Correcting a bill

Open **Sales Register** and click the bill. Change whatever is wrong and press **Save**. The software undoes everything the old version did and re-records it — stock, khata and cash all follow. The bill number does not change.

Delete removes the bill entirely: pieces go back into stock and the khata is reversed.

"Tag ... is not in stock — it cannot be billed again"

You are trying to sell a piece that is already sold or has been melted. Check the tag number. This message is protecting you from selling one physical piece twice.

8. Receiving and Paying Money

Press **F4** or click **Receipts**. Use this when money moves *without* a bill — a customer paying off an old balance, or you paying a supplier.

Receipts and Payments

- **Receipts** — money coming in, usually from a customer.
- **Payments** — money going out, usually to a supplier.

Switch between them with the toggle at the top left.

Recording a receipt

- 1 Press **New Receipt**.
- 2 Start typing the party's name and pick them from the list.
- 3 The software shows their **current balance**, and as you type an amount it shows what the balance **will become**. Check this before saving — it catches wrong amounts immediately.
- 4 Enter the amount and date.
- 5 Choose the payment mode. For anything other than cash, a Bank Name box appears.
- 6 Enter a reference number — cheque number, UPI transaction ID or bank UTR.
- 7 Press **Save**.

Money taken on the bill itself

If the customer pays at the time of purchase, put it in **Amount Received** on the bill instead. Only use this screen for payments that arrive separately.

The list shows every receipt or payment for the chosen dates, with a running total in the badge at the top right. To remove a wrong entry, click the bin icon on its row — the party's balance is corrected automatically.

9. Purchase and Metal Exchange

Press **F3**. Use this when you buy material or finished ornaments from a supplier.

A simple cash purchase

- 1 Press **New Purchase**.
- 2 Choose the **Supplier**. Invoice number and date fill in.
- 3 Choose the **Metal** — Gold, Silver or Platinum. It posts to that metal's stock and to the supplier's khata for that metal. (Refining, karagir issue/receive and cash settlement have the same dropdown.)
- 4 Choose **Cash** or **Credit**.
- 5 On the **Material In** tab, enter what you received.
- 6 Fill in Discount, GST %, TCS % and **Paid Amount** as needed.
- 7 Press **Save Purchase**.

Wastage

Suppliers usually charge a percentage above the pure metal weight to cover their loss in working. Enter it in the **Wastage%** column and the **Fine+Wst** column shows what you are actually paying for. If you have set a **Wastage Master** rule (section 3), typing the item name fills the percentage in for you — change it whenever this supplier has agreed something different.

175 g at 99.5% purity, 2% wastage, ₹6,000 per gram

Fine	$175 \times 99.5 \div 100$	=	174.125 g
Fine + 2%	174.125×1.02	=	177.608 g
Amount	$177.608 \times 6,000$	=	₹10,65,648

Metal-for-metal exchange

Often no money changes hands at all. You give the supplier fine gold and take back finished ornaments, settling only the difference. That is what the second tab is for.

- 1 Enter what you **received** on the **Material In** tab.
- 2 Switch to **Material Out** and enter the metal you **gave** the supplier.
- 3 A **Metal exchange** badge appears, and the strip under the grid shows the settlement.

The Balance Wgt strip

In	— Gross	100.000 g	Net	100.000 g	Fine	91.600 g
Out	— Gross	95.000 g	Net	95.000 g	Fine	94.525 g
Balance	Fine	-2.925 g				

A **negative** balance means you handed over more pure gold than you took back, so the supplier owes you the difference in metal. A positive balance means you received more than you gave.

The value of the Material Out lines appears as **Material Returned** in the summary and is deducted from the bill. If you gave more value than you took, the bill total goes **negative** — that is correct, and means the supplier owes you money.

Both sides are tracked

The money difference goes to the supplier's normal khata, and the metal difference goes to their **gold khata**. See section 14 to view either.

10. Karagir Orders

Press **F5**. Use this when a customer orders something you do not have, and you give the work to a karagir.

Booking an order

- 1 Press **New Order**.
- 2 Choose the **Customer** (required).
- 3 Choose the **Karagir** who will make it — you can leave this and assign later.
- 4 Set the **Delivery Date** you have promised the customer, and the **Karagir Date** — the earlier deadline for the goldsmith to hand the piece back, so you have time to check and finish it.
- 5 Enter the expected items — weights, purity, rate and making charge.
- 6 If the customer gives **old gold** now, enter it in the **Old Gold at Booking** grid. It lowers the balance straight away and is recorded on the customer's gold khata; when you convert the order to a bill it carries across automatically.
- 7 Enter any **Advance Received**.
- 8 Press **Save Order**.

The four stages

Stage	Meaning	Next step
Booked	Customer has ordered	Press <i>Issue to Karagir</i>
Issued	Work is with the karagir	Press <i>Mark Received</i>
Received	Finished piece is back with you	Press <i>Convert to Sales Bill</i>
Delivered	Billed and handed over	Done

Turning the order into a bill

When the piece comes back, open the order and press **Convert to Sales Bill**. A normal sales bill opens with all the items already filled in and the **advance already entered as amount received**. Adjust the final weights and rate to what was actually made, then save and print as usual.

The advance is never counted twice

While the order is open, only the advance appears in the customer's khata — an order is not a sale. When you convert it, the advance moves onto the bill. The customer is charged exactly once.

Watching your orders

The list shows every order with its status. A delivery date that has passed is shown in **red** so overdue work stands out. The tiles at the top show how many orders are open and how much money is still pending.

In **Karagir Job Work**, the order-tracking table shows both dates side by side with their own days-left. A karagir date that has slipped is flagged **red with a ⚠** — a warning that the piece is at risk *before* the customer's own delivery date is in danger.

To cancel an order, open it and press **Cancel Order**.

11. Refining

Press **F9**. Use this when you send scrap, old gold or broken pieces to a refinery and get pure metal back.

Sending metal out

- 1 Press **New Refining Entry**.
- 2 Leave **Direction** on **Send Out**.
- 3 Choose the refinery.
- 4 Enter what you are sending. If a piece has a tag, scan or type it in the **Tag** column and press **Enter** — the weights fill in.
- 5 Use **Wastage** for the burning loss the refiner charges.
- 6 Press **Save Entry**.

Tagged pieces sent for refining are gone from stock

A piece sent to be melted is marked **Melted** and leaves your tagged stock. A warning appears on the screen before you save. If you make a mistake, delete the refining entry and the piece comes back.

Receiving pure metal back

When the refinery returns your gold, make a second entry with **Direction** set to **Receive**. Enter the weight and purity you got back — usually 100% for pure gold — and any refining charges you paid.

Keeping track

The tiles at the top show **Fine Sent Out** and **Fine Received** for the dates chosen, so you can see at a glance how much metal is still lying with the refinery. The refinery's gold khata (section 14) gives the full picture.

12. Gold Saving Scheme

Click **Gold Scheme**. This runs the monthly savings plans where a customer pays a fixed amount for several months and you add a bonus at the end.

Step 1 — create the plan (once)

- 1 Open the **Scheme Types** tab and press **New Scheme**.
- 2 Give it a name, for example *11 + 1 Gold Plan*.
- 3 **Scheme Type** — what the member is really saving up. See the table below.
- 4 **Period** — whether instalments fall due in *Days*, *Months* or *Years*. The labels below change to match.
- 5 **Monthly Amount** — what the member pays each month. On a *Weight Wise* plan this becomes **Monthly Weight** in grams instead.
- 6 **Paying Months** — how many months they pay, for example 11.
- 7 **Total Months** — paying months plus your bonus month, for example 12.
- 8 **Benefit at Maturity** — your contribution at the end, in rupees, in grams, or as a making-charge waiver depending on the type.

A box shows the value at maturity as you type, so you can see exactly what you are promising:

₹2,000 × 11 months = ₹22,000 paid by the member
+ ₹2,000 benefit = ₹24,000 value at maturity

The four kinds of plan

Type	Member pays	They are saving up	Your benefit
On Amount	a fixed amount	rupees	a rupee bonus
On Making	a fixed amount	rupees	making charges waived
On Weight	a fixed amount	grams , worked out at your rate on the day of each payment	extra grams
Weight Wise	whatever that day's grams cost	grams , a fixed number each month	extra grams

Which weight plan should I offer?

Both protect the customer from the gold rate rising. **On Weight** keeps the payment the same — ₹5,000 a month buys more grams when gold is cheap and fewer when it is dear. **Weight Wise** keeps the grams the same — one gram a month is always one gram, and the payment goes up and down instead. Customers who budget by the month prefer the first; customers saving for a particular piece prefer the second.

Step 2 — enrol a member

- 1 Go to the **Members** tab and press **Enrol Member**.
- 2 Choose the customer and the scheme. The amounts fill in from the plan.
- 3 Set the start date and press **Enrol**.

The software immediately creates the **whole instalment schedule** — one row per month with its due date. The last row is your benefit, marked **Shop benefit**, which the member never pays.

Step 3 — collect each month

Open the member from the list. The schedule shows every instalment:

- **Green** — received

- **Red** — overdue
- Plain — not due yet

Press **Receive** on the row being paid, confirm the amount, date and payment mode, and save. Pressed the wrong row? Press **Undo** and it reverses cleanly.

On a **weight plan** the box also asks for the **rate per gram** on the day of payment, and shows you the conversion before you save — ₹6,000 at ₹5,000/g — accrues 1.200 g. The schedule then carries a **Weight** column alongside the amount, so you can always see how many grams the member has built up and at what rate each instalment went in.

Reminders

Press **Remind** at the top to open WhatsApp with a message already written out — the member's name, the amount due, the due date and what they have paid so far. Check it and send.

Step 4 — spending the scheme on a bill

When the member comes to buy, make an ordinary sales bill as usual. Once you have chosen the customer, a **Saving Scheme** box appears in the bill's totals panel listing their open schemes. Pick one and the balance comes off the bill.

- **Scheme Amount** — how much of the balance to spend. Leave it blank to spend as much as the bill can take.
- On a weight plan you also enter today's **rate per gram**, which is what values their grams. The bill then shows how many grams were used.
- **Return in Cash** — if the balance is bigger than the bill, the rest stays on the account for next time unless you type an amount here to hand back.

Scheme money comes off after GST, not before

A discount reduces what you charge tax on. Scheme money is different — it is the customer's own deposit being handed back, so GST is charged on the full bill first and the scheme money then settles it, exactly like cash would:

Bill amount	52,000.00
+ GST @ 3%	1,560.00
= Total	53,560.00
- GSS Amount	6,000.00
= To pay	47,560.00

An **On Making** plan is the exception: waiving making charges genuinely does reduce the bill, so that one goes in *before* GST and the tax falls with it.

Closing an account

When the scheme matures and the customer takes their jewellery, press **Close Account**. It stays in your records and can be seen under the **Closed** filter.

The balance always tells the truth

A member's balance is worked out fresh from their receipts, less whatever bills have already spent. Undo a receipt, correct a bill or delete one and the balance simply re-reads correctly — there is nothing to reverse by hand and no way for it to drift. Your benefit is only added once *all* the paying instalments are in and the maturity date has passed, so a member who stops halfway gets back what they put in.

Scheme money is kept separate

Money collected under a scheme is a deposit you are holding, not a sale. It is kept in its own account and deliberately does **not** appear in the customer's normal buying-and-selling khata, so neither figure confuses the other.

13. Checking Your Stock

Stock Report

Click **Stock Report** to see what you are holding.

In Stock / Sold / All	Which pieces to show
Tag-wise (detail)	Every individual piece with its tag
Item Name Total	One line per item — Ring, Chain, Bangle and so on
Summary by Item Group	Totals for 22K Gold, 18K Gold, Silver...
Summary by Location	Totals for Shop, Locker and any other location

In **Item Name Total** the **Purity** column is the purity the whole line would have if it were a single piece — worked out from the weights, not by averaging the percentages. That matters: a 1 g scrap ring at 50% should not drag the figure down as much as a 50 g chain at 100%, and this way it does not.

The tiles across the top give **Pieces**, **Gross Weight**, **Net Weight**, **Fine Weight** and **Value at Cost**. **Fine weight is the number that matters** — it is your actual pure gold, whatever purity the pieces are.

Value at Cost

This is what the stock *cost you*, not what it would sell for:

$$\text{Value at Cost} = \text{Fine Weight} \times \text{Cost per gram}$$

The cost per gram comes from the **Cost/Gm** column you fill in when tagging (see *Tag & Barcode*). If you left it blank on some pieces, those pieces are **left out of the total** and the tile tells you how many were excluded — so a partial figure never reads as the full stock value. In the summary views an asterisk marks any group that contains uncosted pieces.

Cost is for your eyes only. It is never printed on a customer's bill.

Export saves whatever you are looking at as a CSV file for Excel.

Correcting a piece after a count

Found a piece that weighs differently to what was typed in, or a purity entered wrong? You do not have to delete the tag and start again.

- 1 Switch to **Tag-wise (detail)** and leave the filter on **In Stock**.
- 2 Press **Edit Stock**. The grid turns into boxes you can type in.
- 3 Correct **Gross Wt**, **Stone**, **Purity**, **Cost/Gm**, **Location** or **HUID** on any rows you need. Changed rows turn green as you go.
- 4 Press **Save**. The button shows how many pieces you have changed.

Net Wt and **Fine Wt** are worked out for you and update as you type — you never enter them by hand. Your metal on hand moves with the correction too, so the Day Book and the stock position stay right.

Sold pieces cannot be changed here

A piece that has been sold is already priced on a customer's bill. Changing its weight on this screen would leave the bill and your stock telling two different stories, with nothing to say which one is right — so the software refuses, and tells you which tag. Open the bill and correct it there instead. If any row in a save is refused, **none** of them are saved, so you never end up half-corrected.

The Day Book

Click **Day Book** and pick a date. This is your end-of-day check.

The right-hand panel, **Cash And Bank Accounts**, shows for each metal what you started the day with and what you finished with, in **three weights**:

Gold :-	Opening	Closing
Gross Wt	492.100	540.300
Net Wt	492.100	540.100
Final Wt	467.564	517.412

Use **Gross Wt** when you physically weigh your trays — that is the number a count produces. **Net Wt** takes the stones out, and **Final Wt** is the pure metal inside. Old gold taken from customers has its own block underneath, so it never gets mixed up with your own stock.

Below that, every **cash and bank account** with its opening and closing balance, then **Today Received Details** — what came in today, split by whether it was cash, card, UPI, NEFT or cheque, counting both bills and receipts.

Only cash goes in the cash drawer

A card swipe, a UPI transfer, NEFT or a cheque all go to the **bank**, not the drawer — that is where the money actually lands. So if your drawer does not match the Cash Account figure at closing, something really is missing, and the number is worth trusting.

Branches and moving stock between them

Click **Branches & Transfer**. Use this if you have more than one shop, or a locker you keep stock in.

- 1 On the **Branches** tab, add each shop or locker by name.
- 2 On **Transfers**, press **New Transfer**.
- 3 Choose the branch the pieces are leaving and the one they are going to.
- 4 Scan each barcode, or press **Add** beside it in the list underneath.
- 5 Press **Save Transfer**.

The top of the screen always shows **where your stock is** — pieces, weight and value at each branch. Got a transfer wrong? Delete it and every piece goes straight back where it came from.

A piece can only be in one place

The software will not let you send a piece from a branch it is not actually at, or one that has already been sold — either would create stock out of thin air at the other end. If you rename a branch, everything recorded there comes with it.

If a piece has been moved on again since, you must delete the *newer* transfer first — otherwise undoing an old one would drag the piece backwards past a move that still stands. The software tells you which document is in the way.

Stock Verification — the physical count

Click **Stock Verification**. Use this to check that what is in your safe matches what the software says. Do it monthly at least.

- 1 Take out your pieces tray by tray.
- 2 Scan each barcode, or type the tag number and press **Enter**.
- 3 Each piece you scan turns **green** and the **Found** counter goes up.
- 4 When you have scanned everything, switch the filter to **Missing**.

Whatever is still **red** is not physically in your shop. Those are the pieces to hunt for.

The four counters

Expected	What the software says you should have
----------	--

Found	What you have scanned
Missing	Not scanned — investigate these
Not In Stock	You scanned a tag the software does not expect: already sold, melted, or from another branch

Counting changes nothing

This screen never alters your records. It only tells you what does not match. Press **Reset** to start a fresh count, or **Export** to save the sheet as evidence of the count.

14. Reports and Khata

Dashboard

The first screen you see each morning: today's sales, this month's sales, stock in hand in fine grams, and total receivable. Under it are quick buttons for the four commonest jobs, and your recent bills — click any one to open it.

Sales Register

Every bill for a chosen date range. Three tiles show number of bills, total sales and total outstanding. Each row has a **print** and a **WhatsApp** button. Click a row to open and edit the bill. **Export** gives you a CSV.

Day Book — closing the day

Click **Day Book** and press **Today**. This is your end-of-day check.

- **Transactions** — sales, purchases, old gold, receipts and payments, split into cash and credit.
- **Stock & Cash Position** — opening and closing figures for gold stock (in fine grams), old gold (URD) stock, and cash.

Count the cash in your drawer against the closing cash figure before you lock up.

Ledger / Khata — the most useful report

Click **Ledger / Khata** and search for a customer or supplier. You get the traditional two-column account, exactly as in a handwritten khata book.

There is a **Money / Metal / Money + Metal** switch at the top. This is important: a party can owe you rupees and owe you metal, and they are two different things.

When you choose **Metal** or **Money + Metal**, a small dropdown appears — **Gold, Silver** or **Platinum**. Each metal has its own khata; gold owed is gold and silver owed is silver, never mixed together. Most shops only ever use Gold, and it is selected for you.

Money khata

Dr — What they owe		Cr — What they paid	
01/Apr Opening Balance	9,500	19/Jul Cash Account VR1	30,000
15/Jul Sales Account	49,687	By Balance c/d	29,187
Total	59,187	Total	59,187
To Balance b/d ₹29,186.75 Dr			

Gold khata

Dr — Metal we gave them		Cr — Metal they gave us	
14/Jul Metal exchange	94.525	13/Jul Purchase	177.608
		14/Jul Metal exchange	91.600
Balance	174.683 g fine Cr		

Dr means they owe you; **Cr** means you owe them. In the example above, you are holding 174.683 grams of fine gold belonging to that supplier.

Returns — goods coming back

Open **Returns** from the sidebar. A return is a **new document**, not a change to the old bill: the original bill stays exactly as you printed it, and the return puts the stock, the money and the gold back on the day the goods actually came in.

Once a bill is printed and in your books, deleting it changes history and your day book for that day will no longer match what you handed the customer. Raise a return instead.

- A tagged piece that comes back becomes sellable again straight away, and the customer's gold khata is reduced by the fine weight returned.

Go to **Orders** → **Karaqir Job Work** and pick a goldsmith. This is where you keep him honest:

- 1 **Issue Material** — enter the weight and purity you are handing over. It leaves your stock and goes onto his account.
- 2 When the finished piece comes back, press **Receive Order**. Enter what you weighed, the **wastage %** you are allowing him, and the making rate. TDS and a part payment can be entered here too.
- 3 Watch the **Still With Karagir** tile. It should be zero. Anything left is gold he has not accounted for, and it shows in red.

The table at the bottom shows every order with its delivery date and how many days are left. Anything past its date turns red, so you can see at a glance what is late before the customer walks in asking.

Sometimes a gold balance needs to be closed in money instead of metal — you owe a supplier 100 g and you would rather pay for it. Go to **Receipts & Payments** → **Metal Settlement** and press **New Settlement**.

- ### Example

After saving:

Parivar Jewellery ERP — User Manual

This settles the
account

, not the shelf. The metal itself moved earlier on its own purchase, sale or refining bill, so your stock figures do not change here.

Money + Gold — one statement

The third button, **Money + Gold**, shows both books on a single sheet. Each bill, receipt or payment is *one line*, with what it charged, what was received, how much metal moved and which way — and two running balances side by side: rupees and fine grams.

Date	Doc	Transaction	Fine Wt	In/Out	Amount	Received	Balance Rs
Balance							
		Opening Balance					9,500 Dr
10.000	Dr						
21/07/26	COM1	Sale bill (weightwise)	4.000	OUT	25,750.00		35,250 Dr
14.000	Dr						
21/07/26	VR1	Cash Account				20,000.00	15,250 Dr
14.000	Dr						
		Closing Balance					15,250 Dr
14.000	Dr						

Use this when a customer deals in both — it answers “what do they owe me?” in one look, in **both** money and gold, without switching screens.

The two balances are kept separate on purpose. Gold owed is gold, not rupees; its value changes with the rate every day, so it is never converted into a money figure for you.

Export saves any of the three views as a CSV file.

Outstanding — who owes whom, at a glance

Click **Outstanding** for two lists side by side: **Debtors** (everyone who owes the shop) and **Creditors** (everyone the shop owes), each with a running total. Two tiles at the top show your total receivable and total payable.

A **Money (₹) / Metal (g)** toggle reads the same thing two ways. In **Money** it is rupees from the khata. In **Metal** a dropdown picks Gold, Silver or Platinum and the lists show *fine grams* owed in that metal — never turned into a rupee value, because metal owed is metal and its price changes daily. Use this to chase payments, or to see at a glance how much gold your customers are holding against you. Exports to CSV.

Accounting Books — Trial Balance, Profit & Loss, Balance Sheet

Click **Accounting Books** for the three statements your accountant asks for. Pick a date range at the top — it opens on the current financial year (1 April to 31 March); **This FY** resets it. Three tabs across the top switch between the books.

- **Trial Balance** — every account with its Debit or Credit balance, in two columns that must add up to the same total. They always do; anything the books cannot otherwise place (usually your own capital brought forward) appears as its own line called *Capital / Opening Difference*.
- **Profit & Loss** — a Trading account that works out your *Gross Profit* (sales plus closing stock, less purchases and old gold), then a Profit & Loss account that takes off shop expenses, karagir labour, refining and discounts to reach *Net Profit*. Two tiles at the bottom show both figures.
- **Balance Sheet** — what the business owns (cash, bank, money customers owe, stock at cost) against what it owes (suppliers, GST, scheme deposits) and your capital. The two sides always match; capital carries the profit the period earned.

These books are built from your bills, purchases, receipts and payments — you do not post journal entries by hand. Two things to know: **stock is valued at what you paid for it** (the same *Value at Cost* as the Stock Report), taken from what is in stock right now; and **gold is not mixed into the rupee books** — metal has its own weight statement in the Ledger. Each book exports to CSV.

Cash Book & Registers

Click **Cash Book & Registers** for the day-to-day listing books. Three tabs across the top:

- **Cash / Bank Book** — every receipt and payment through the account with a running balance, so you can tally the cash drawer or reconcile the bank. The dropdown switches between the Cash Book and the Bank Book.
- **Journal** — every entry the software posted, in date order, with the account it touched and the debit or credit. This is the full audit trail behind the khata.
- **Sales & Purchase Books** — a register per document: Sales, Sales Return, Purchase, Purchase Return. Each lists the documents with their taxable value, GST and total, and totals the columns at the foot — handy at GST-return time.

Pick a date range at the top (it opens on the current financial year). Every view exports to CSV.

GST Reports

Click **GST Reports** at return time. Five tabs give you what the monthly return needs:

- **GSTR-1** (your sales) and **GSTR-2** (your purchases) list every taxable bill and split the tax correctly — **CGST + SGST** when the customer is in your own state, **IGST** when they are in another — and mark each as **B2B** (a registered dealer, GSTIN on file) or **B2C** (a counter sale). Set your own state in **Settings** → **Company** so the split is right.
- **GSTR-3B** is the summary: tax you collected on sales, less the credit for tax you paid on purchases, giving what you actually pay in cash (or the credit that carries to next month).
- **HSN Summary** groups your sales by HSN code with the taxable value and tax — the annexure the return asks for.
- **TCS / TDS** lists the TCS you collected on large sales and the TDS you withheld from karagir labour, so you know what to deposit.

The GSTR-3B figures are the same as the GST line in the Accounting Books — one number, two places, always in agreement. Everything here exports to CSV to hand to your accountant or upload to the portal.

14b. Reports for the Owner (MIS)

Click **MIS & Scheme Reports**. These answer the questions the daily screens cannot.

Non-Moving Items	Pieces sitting in stock untouched, with how long they have been there and what they cost you. This is money on a shelf.
Quiet Customers	People who used to buy and have not been in. Their last bill and what they have spent with you overall — a call list.
Top Selling Items	What actually sells, by value.
Top Areas	Where your customers come from.
Purity Profit	What you sold against what it cost, per purity.

Change **Quiet after** to set how many days counts as "not moving" and "gone quiet" — 90 days by default.

Profit only counts what you recorded a cost for

A piece sold without a **Cost/Gm** is left out of the profit figures completely, and the screen tells you how many were left out. It would be worse to count them as costing nothing — that would show as pure profit and flatter your margin. Fill the cost in on the Stock Report and it joins the figures.

The second tab, **Gold Scheme Reports**, lists your schemes, every member and their balance, instalments due, instalments received, and bills paid for with a scheme.

15. Printing, WhatsApp and PDF

Printing a bill

Press **Save & Print** on the sales bill, or the printer icon on any row in the Sales Register. Your normal Windows print dialog opens.

The layout follows what you set in **Settings** → **Invoice Design** — A4 or thermal, which columns show, whether bank details and the declaration print. Set that up once and every bill follows it.

Saving as PDF

Press **PDF**, choose where to save, and the file is created. Useful for emailing a bill or keeping a copy.

Sending on WhatsApp

Press the **WhatsApp** button. WhatsApp opens with the bill details already written out — items, weights, amounts and balance.

Nothing is sent automatically

The software only opens WhatsApp with the message prepared. **You** read it and press send. The same applies to reminders and statements.

For this to work, the customer must have a WhatsApp number saved. If not, you will see "No mobile number on this record" — add it under Customers.

Exporting to Excel

Most report screens have an **Export** button which saves a CSV file. Open it in Excel to make your own summaries or send to your accountant.

15b. Seeing the Books on Your Phone

You do not have to be at the counter to know how the day went. The software can show today's sales, the stock in the trays, any customer's or supplier's khata, the day book, who owes what, and any bill — on a phone that is on the **same Wi-Fi** as the billing computer.

Look, never touch

A phone can only **read**. There is no way to make, change or delete a bill, a receipt or a piece of stock from it, whoever is signed in. Everything is still entered on the computer.

Switching it on (owner only)

1. Go to **Settings** → **Mobile View** and tick **Turn on mobile view**.
2. The first time, Windows asks whether to allow "Parivar Jewellery ERP" on private networks. Choose **Allow**. If you choose Cancel by mistake, phones will never connect — see Problems and Solutions.
3. A square code and an address such as `http://192.168.1.42:8765` appear on the screen.

Opening it on the phone

1. Connect the phone to the shop Wi-Fi — the same one the computer uses.
2. Point the phone camera at the square code and tap the link that appears, or type the address into Chrome or Safari.
3. Sign in with the same username and password you use on the computer.
4. In the browser menu choose **Add to Home Screen**. From then on it opens with one tap, like any app.

The phone stays signed in for twelve hours, then asks again. The bottom bar switches between Home, Stock, Sales, Khata, Day Book and Dues. Tap a bill to see its lines; tap a name to open their khata, with a **Money | Gold** switch at the top.

What it can and cannot do

Works	Does not
Any phone or tablet with a browser — Android, iPhone, iPad	A phone outside the shop, on mobile data. It must be on the shop Wi-Fi.
Several phones at once, each with their own login	Making or editing anything. It is a window, not a door.
Staff logins as well as the owner	A login the owner has disabled — it is cut off immediately, even mid-session.
Working while the computer is signed out, as long as the software is open	Working while the software is closed or the computer is off.

Keep it inside the shop

Nothing is on the internet. The address only works on your own Wi-Fi. Do not set up "port forwarding" on the router to reach it from outside — that would put your books one password away from anyone. If you need the figures away from the shop, take a backup to Google Drive instead and open it on another computer with the software.

Five wrong passwords in a minute from one phone and that phone is made to wait, so the password cannot be guessed by trying. Switch mobile view off from the same Settings tab at any time; every phone is signed out at once.

16. Backup — Do This Every Day

This is the most important page in this manual

All your data is in one file on this one computer. If the disk fails and you have no backup, every bill, customer and stock record is gone permanently. No one can recover it.

Taking a backup

- 1 Go to **Settings** → **Data & Backup**.
- 2 Press **Create Backup**.
- 3 Choose where to save. The file is named with today's date automatically.
- 4 The folder opens so you can confirm the file is there.

Where to keep backups

Place	Why
Pen drive	Keep it away from the shop. Protects against fire and theft.
Google Drive or OneDrive folder	Copies itself off-site automatically
Second computer	Protects against one machine failing

A simple routine that works

Take a backup to a pen drive every evening before locking up, and keep a second copy in a cloud folder once a week. Keep at least the last seven days — if a mistake goes unnoticed for a few days, you can still go back.

Restoring from a backup

Use this when the computer has been replaced, the data file has been damaged, or something has gone badly wrong and you want the books as they were. Only the **owner** can do it.

- 1 Go to **Settings** → **Data & Backup**.
- 2 Press **Choose Backup File...** and pick the `.db` file.
- 3 The app reads the file and shows you what is inside it — shop name, how many customers, tagged pieces and bills, and the date of the last entry — next to the same figures for what is in the app right now. **Nothing has changed yet.**
- 4 Check the two columns. If the backup is the one you want, press **Replace my data**.
- 5 The app restarts by itself. Sign in again and check the Day Book.

Everything currently in the app is replaced.

Any bills, receipts or stock entered since that backup was taken will no longer be there. If you are unsure, take a fresh backup first — then you have both.

You can undo a restore

Just before replacing anything, the app saves your current books as a file named `pre-restore-... .db` in the data folder (the location is shown at the top of the same screen). If you restore the wrong file, restore that one to get straight back.

If the file you choose is not a backup, is from a different program, or has been damaged, the app refuses it and tells you why. Your books are not touched.

Moving to a new computer

Your whole shop is one file, so changing computers is a backup and a restore. Nothing is typed in again and no bill number changes.

1. **On the old computer:** finish the day's entries. Go to Settings → Data & Backup, press **Create Backup** and save it to a pen drive. Note the bill count on the Dashboard so you can check it later.
2. **On the new computer:** run the same installer (or a newer one — a newer version reads an older backup). Open the software and sign in as admin / admin.
3. Go to Settings → Data & Backup, press **Choose Backup File...** and pick the file from the pen drive. Check the figures shown side by side — shop name, customers, pieces, bills, last entry date — then press **Replace my data**.
4. The software restarts. Sign in with your *real* logins — they came across in the backup, including every staff login and password. Check the Dashboard bill count matches the note you made.
5. Set up what lives outside the data file: the printer and its paper size, **Settings** → **Invoice Design** (which is saved per computer — press Test Print), Google Drive (press Connect again on the new machine), and Mobile View if you use it (Windows will ask to allow it once more).
6. Only when the new computer has run a full day correctly, stop using the old one. Do not enter bills on both — the second machine's entries would be lost.

The old computer is your fallback

Leave the software and data on it for a few weeks before wiping it. If anything is wrong on the new machine, you can still take a fresh backup from the old one.

Backing up to Google Drive

The app can upload the backup to your own Google Drive with one press, or once a day by itself.

One-time setup

Google requires every program that touches Drive to be registered first. Doing this yourself means the backups sit in **your** Drive, under your control, and nobody else can reach them. It is free and takes about five minutes.

Go to **Settings** → **Data & Backup** → **Google Drive Backup** and press **Show me how**. The software walks you through all seven steps. In short:

- 1 Open `console.cloud.google.com` and create a project.
- 2 Enable the **Google Drive API**.
- 3 Fill in the OAuth consent screen and set it to **In production**.
- 4 Create an **OAuth client ID** of type **Desktop app**.
- 5 Paste the Client ID and Secret into the app.

Set the consent screen to "In production"

If it is left on "Testing", Google cuts the connection every seven days and you have to sign in again and again.

Connecting and backing up

- 1 Press **Connect Google Drive**. Your browser opens Google's sign-in.
- 2 Choose the account that should hold the backups and press **Allow**.
- 3 Come back to the app — it now shows which account is connected.
- 4 Press **Back Up Now** whenever you like, or tick **Back up automatically once a day**.

Backups go into a folder called **Parivar Jewellery ERP Backups**. The newest ten are kept and older ones removed, so your Drive does not fill up. Press **Show backups in Drive** to see what is there.

What the app can see in your Drive

- It can only touch the backup files it created itself.
- It **cannot** read, list or change anything else in your Drive.
- Your Google password is never seen by this software — you type it on Google's own page.
- You can cut off access any time at `myaccount.google.com/permissions`, or press **Disconnect** in the app.

Do not rely on one backup alone

Google Drive is excellent, but keep a pen-drive copy too. Two places, not one.

Restoring

A backup is a complete copy of your data file. To restore it, close the software, copy the backup into the data folder shown on the Data & Backup screen, and rename it to `parivar.db`. If you are unsure, ask whoever supports your computers — do this carefully, as it replaces everything.

17. Keyboard Shortcuts

Learning these five or six will make you much faster.

Key	What it opens
Ctrl + K	Search box — jump to any screen or customer
F2	Sales Invoice
F3	Purchase
F4	Receipts
F5	Orders
F6	Item Creation
F7	Tag & Barcode
F8	Customers
F9	Refining

Inside lists and boxes

Key	What it does
↑ ↓	Move through a suggestion list
Enter	Choose the highlighted suggestion; in the Tag box, look up the tag
Esc	Close the suggestion list or the open window
Tab	Move to the next box

18. How Every Number Is Calculated

Nothing is hidden. Every figure the software shows comes from one of these formulas.

Weights

Net Weight = Gross Weight - Stone Weight - Black Beads
Fine Weight = Net Weight × Purity ÷ 100

Example: 10.000 g gross, no stones, 91.6% purity

Net = 10.000 g

Fine = 10.000 × 91.6 ÷ 100 = 9.160 g

A sales bill

Goods Amount = Net Weight × Rate per gram
Making Amount = Net Weight × Making per gram
Bill Amount = Goods + Making + Hallmark charges
Taxable = Bill Amount - Bill Discount - Making Discount
GST = Taxable × GST %
Total = Taxable + GST + Other charges + TCS
Balance Due = Total - Old Gold value - Amount Received - GSS Amount

Example: 12.000 g at ₹4,590, making ₹300 per gram, GST 3%

Goods	12.000 × 4,590	=	₹55,080.00
Making	12.000 × 300	=	₹3,600.00
Bill		=	₹58,680.00
GST 3%		=	₹1,760.40
Total		=	₹60,440.40

Old gold taken from a customer

Fine Weight = Net Weight × Purity ÷ 100
Value = Fine Weight × Rate per gram

Example: 3.000 g at 80% purity, allowed at ₹4,500

Fine	=	3.000 × 80 ÷ 100	=	2.400 g
Value	=	2.400 × 4,500	=	₹10,800.00

A purchase

Fine + Wastage = Net × Purity ÷ 100 × (1 + Wastage %)
Amount = Fine + Wastage × Rate per gram
Bill Amount = Purchase - Discount - Material Returned + GST + TCS

Refining

Fine Weight = Net Weight × Purity ÷ 100
Amount = Fine Weight × Rate per gram

Gold saving scheme

On Amount / On Making

Value at Maturity = Monthly Amount $\times$ Paying Months + Shop Benefit

On Weight (fixed money, grams follow the rate)

Grams accrued = Amount Paid $\div$ Rate on the day

Balance = All grams accrued + Benefit grams

Weight Wise (fixed grams, money follows the rate)

Amount to pay = Monthly Weight $\times$ Rate on the day

Balance = Monthly Weight $\times$ Paying Months + Benefit grams

Spending it on a bill

To pay = Total (incl. GST) - Old Gold - Received - GSS Amount

Example: 6,000 paid when gold is 5,000/g = 1.200 g accrued
the same 6,000 at 6,000/g = 1.000 g accrued

Balances

Money balance = Opening + (all debits - all credits)

Gold balance = Opening + (metal given - metal received)

Positive = Dr = they owe you

Negative = Cr = you owe them

19. Problems and Solutions

What you see	What to do
"Tag ... is not in stock — it cannot be billed again"	That piece is already sold or has been melted. Check the tag number. The software is stopping you selling one physical piece twice.
"Tag ... cannot be sent for refining"	Same reason — the piece has already left your stock.
"A credit bill needs a customer"	You marked the bill Credit but did not choose a customer. Either pick one, or switch the bill to Cash.
"Cannot delete: this item already has stock tags"	Delete or sell the tagged pieces first.
"Cannot delete: this party already has transactions"	Deleting them would break their bills and khata. Leave them in place.
"Invalid username or password"	Check both, and that Caps Lock is off. Usernames ignore capitals but passwords do not. If it is still refused, ask the owner to reset it.
"This account is disabled"	The owner has switched this login off. They can enable it under Settings → Users.
"This action is restricted to an authorised role"	Your role may not do that — see the table in section 3. Ask the owner to do it, or to raise your role.
"Please sign in to continue"	The session ended. Sign in again.
Nobody knows the owner password	Any Owner login can reset another user's password. If every owner password is lost, the data file must be restored from a backup taken when it was known — another reason to keep backups.
"No mobile number on this record"	Add a WhatsApp or mobile number for that customer under Customers.
The item search finds nothing	Only pieces <i>in stock</i> are offered. If it is sold or melted it will not appear. Check the Stock Report.
Nothing appears in a report	Check the date range at the top. Most reports open showing this month only.
Fine weight looks wrong	Check the purity on the tag. A 22K piece entered at 75% will show far less fine weight than it should.
The customer's balance looks wrong	Open their khata (Ledger) and read down the entries. Every figure has a document number beside it, so you can find the bill or receipt that caused it.
A bill was made by mistake	Open it from the Sales Register and press Delete . The pieces go back into stock and the khata is reversed.
"Only ... g of loose metal is available"	You are trying to make pieces from more metal than you hold loose. Check the weights, or enter the purchase that brought the metal in. If the pieces were bought ready-made, use New stock mode instead.
Stock looks twice what it should	Metal was probably purchased and then tagged using New stock instead of From loose metal , so it was counted twice. Delete those tags and re-enter them as a conversion.
Pasted rows do not appear	The first column must be a gross weight. Check the column order shown above the grid, and that you copied cells rather than a picture.
Barcode labels print off-centre	Choose the right label size in the print window, print one sheet on plain paper and compare, then adjust. Use Skip labels for a part-used sheet.
The scanner does not read a label	Print larger — use the A4 sheet of 24 rather than 65 — and make sure the label is not creased across the bars.

Phone cannot open the mobile view address	Check the phone is on the shop Wi-Fi, not mobile data, and that Mobile View is on in Settings. If Windows was told to block the app when it first asked, open Windows Security → Firewall & network protection → Allow an app through firewall, and tick "Parivar Jewellery ERP" for private networks. Some routers keep Wi-Fi devices apart from each other ("AP isolation") — switch that off.
"Too many attempts" on the phone	Five wrong passwords in a minute. Wait a minute and type it carefully — the password is case-sensitive.
Google Drive keeps asking me to reconnect	The OAuth consent screen is still set to "Testing", which expires access every seven days. Set it to "In production" in the Google Cloud console.
"Could not reach Google"	No internet, or a firewall is blocking it. Ordinary pen-drive backups still work offline.
Printing is misaligned	Go to Settings → Invoice Design, check A4 or Thermal is right for your printer, and use Test Print until it lines up.

Golden rules

- **Give every person their own login**, never share one, and sign out when you leave the counter.
- **Correct, do not duplicate.** Edit the wrong bill rather than making a second one to cancel it.
- **Take a backup every day.**
- **Verify stock monthly.** Small differences found early are easy to explain.

20. Glossary

Term	Meaning
Gross weight	The full weight of a piece including stones
Net weight	Gross weight less stones and black beads — the metal only
Fine weight	The pure gold in a piece. Net weight × purity.
Purity / Tunch	Percentage of pure gold. 22K = 91.6%, 18K = 75%.
Making charge	Labour charge, usually per gram
Wastage	Extra weight charged to cover metal lost in working
URD / Old gold	Unregistered dealer purchase — old jewellery bought from a customer
Tag	The unique number given to one physical piece, e.g. RIN00001
HUID	Hallmark Unique ID — the six-character code on hallmarked jewellery
HSN	The GST classification code. 7113 for gold jewellery.
Karagir	The craftsman who makes ornaments to order
Refinery	Where scrap gold is melted and purified
Khata	A running account for one party
Dr (Debit)	They owe you
Cr (Credit)	You owe them
Balance b/d	Balance brought down — what is carried forward
GSS	Gold Saving Scheme — the monthly savings plan
TCS	Tax Collected at Source, on large sales
Loose stock	Metal held without an individual tag — bars, scrap, refinery returns, old gold
Conversion	Turning loose metal into tagged pieces; the weight moves rather than being added

Code 128	The barcode standard used on the labels — read by any ordinary scanner
CSV	A simple spreadsheet file Excel can save and this software can read
Role	What a login may do — Staff, Manager or Owner
Owner	The highest role: full access, including staff logins and backups

Parivar Jewellery ERP · User Manual · Version 1.0
 Keep this manual near the billing computer.
